

4. Key Metrics (750 words) • Describe the innovation, its design and its technology. How does it work? • What is new or proprietary about the innovation? • How does it meet needs and resolve pain points? • What impact does the innovation create for individual users and humankind? Describe this qualitatively and quantitatively. • How can new or proprietary aspects be protected and made valuable by one or more methods such as a patent, trade secret, copyright or otherwise competitively defensible configuration?

HavenScan is a modular system designed to cover all aspects of your home inspection. Each part covers a portion of the home inspection process, ranging from air quality to electricity, connecting back to the hub module to deliver results and a final report that keeps you updated on your home's condition. This innovation will help households that don't have enough time or money to perform a regular home inspection. This is a unique approach because it will combine multiple parts of the home inspection into a single process, increasing efficiency and breadth. Using environmental data, this device will be attuned to the surroundings in which the module is being used, thus making each inspection unique, a common oversight attributed to the pervasiveness of using a standard checklist. Depending on the severity, HavenScan will immediately send an alert to your phone and include it in a monthly report that quantifies your home's health and suggests changes you could make.

It comprises one core module integrated with a camera-based identification system that connects to the dashboard via WiFi and serves as the central management console between the different sensors and users. It will also include additional add-on sensors, such as humidity, IMU, air quality, temperature fluctuations, an electrical (microphone-based) system, water continuity, and more.

The uniqueness of this approach ensures full-home coverage within a single system, a first. It will use all of the aspects of this system and
